SPRINGFIELD, VA. 22161

## FOREWORD

This report describes real-time freeway incident and non-incident data collected from the San Diego Freeway in Los Angeles, California. The data was used in the development of freeway incident detection algorithms and a microscopic freeway simulation model. The data has been collected from freeway loop detectors every 20 seconds. In that the data may be of use in many other applications, it has been retained on magnetic data tapes. If a user wishes to use any of the available magnetic data tapes, they should contact the Federal Highway Administration, Traffic Systems Division, HRS-33, Washington, D. C. 20590..

This report is being distributed on a limited basis to selected researchers, a few Washington Headquarters specialists, and NTIS.

Charles F. Scheffey  
Director, Office of Research

## 14. Abstract

The results of the project to collect freeway traffic data for use in developing and verifying incident detection algorithms are presented in three volumes. This volume gives a description of the first 200 data sets collected from a 42-mile freeway loop that had magnetic detectors at approximately one-half mile intervals. Included are a description of the freeway system used, classification of the data sets, description of 200 data sets, an overview of an analysis program that will process the data sets, weather conditions and a description of the incident. Other volumes in this report include:

Vol. No.	FHWA No.	Title
2	RD-76-176	Traffic Data Sets from Closely Spaced Detectors
3	RD-76-177	FORTRAN Program Documentation for Analyzing Individual Data Sets

## 17. Key Words

Freeway, traffic data, data records, peak hour traffic, daily traffic, data reduction, surveys/data/collection

## 18. Distribution Statement

No restrictions. This document is available to the public through the National Technical Information Service, Springfield, Virginia 22161

## 1. PROJECT LOCATION

The Los Angeles Area Freeway Surveillance and Control Project (LAAFSCP) provided the basis for this data collection study. The California Department of Transportation had already installed loop detectors in the freeway lanes at about  $\frac{1}{4}$  mile spacing on 42 miles of urban freeway. These detectors were connected, over phone lines, to a central computer which polls each loop 15 times a second in order to build summaries of vehicle counts and occupancy to be used in ramp metering control and incident detection.

Figure 1 shows the freeways that are under LAAFSCP's control. The Harbor Freeway is an eight lane north-south route that runs from the San Pedro Harbor area to the Los Angeles Central Business District where it becomes the Pasadena Freeway. Average daily traffic on this freeway runs from 110,000 in the south to 210,000 in the north end. Interchanges on the Harbor Freeway are generally either diamond or cloverleaf. The Santa Monica Freeway is another eight lane freeway, which runs from the beach area in Santa Monica to the Central Business District and then feeds into two other freeways. Interchanges on the Santa Monica are diamond, cloverleaf and collector/distributor road. Average daily traffic on the Santa Monica is 124,000 on the west end and 230,000 on the east end. Both the Santa Monica and Harbor Freeways carry heavy directional peak hour flows with traffic coming into the CBD in the morning and going out in the evening.

The San Diego Freeway is an eight lane freeway that runs along the western portion of the Los Angeles area. The portion under LAAFSCP control runs from the southern end of the Harbor Freeway to the western end of the Santa Monica Freeway and carries an ADT of from 170,000 to 210,000. Interchanges on the San Diego vary from diamond to cloverleaf to collector/distributor road.

## 2. DETECTOR STATION LOCATIONS

Loop detector stations are spaced at about one-half mile intervals over the 42 miles of freeway. Tables 1, 2 and 3 give a listing of the number of lanes at each station, the actual distance between stations and the total lane miles between stations.

While all lanes at each station have detector loops installed, not all loops are connected to the computer. Partial count stations, with only one or two loops being used, are intermixed with the full count stations. Generally, every other to every third station is a full count station. A 4-mile section at the northern end of the San Diego Freeway has all stations connected as full count and was used to collect 25% of the data sets.

Appendix A is a set of maps showing the general freeway layout, number of lanes, ramp and connector locations, and which lanes are actually connected to the computer.

### 3. DATA CLASSIFICATION

Of the 200 data sets collected for this project, 150 were to contain an incident of some kind, where an incident may be defined as something abnormal that occurred within the roadway or something unusual outside the roadway that affected traffic. The remaining 50 sets were to be non-incident in that nothing unusual happened during that period. Normal heavy traffic that causes stop-and-go conditions would not be considered an incident, while a car stalled in a lane or on a shoulder creating the same type of condition would be.

Within each incident and non-incident category there were four sub-categories according to the traffic level at the time of the incident. Category 1 was an incident that occurred when freeway occupancy was over 24% occupancy, categories 2, 3 and 4 were for occupancies less than 24% and lane volume levels of over 1400 vph for category 2; 700 vph to 1400 vph for type 3; and less than 700 vph for type 4. Twenty-five percent of the data sets in each subcategory was to be obtained from the fully instrumented section on the San Diego Freeway. Categories 5, 6, 7 and 8 are the corresponding non-incident divisions.

The number of data sets that were originally scheduled to be collected were:

	Incident			Non-Incident		
Type	1	2	3&4	5	6	7&8
Total	60	45	45	20	15	15
Full Instrumented	15	12	12	5	4	4

The numbers actually collected vary slightly due to lack of detectable incidents in some of the categories. The number of sets actually collected were:

	Incident			Non-Incident		
Type	1	2	3&4	5	6	7&8
Total	54	57	42	21	15	11
Full Instrumented	14	16	16	9	6	4

Appendix B gives a narrative description of each data set giving the type of incident and general traffic and weather condition.

#### 4. DATA SET FORMAT

Each data set is recorded on a separate 800 bpi 9-track magnetic tape with fixed length logical records. The format used for all tapes is identical except that the number of data blocks will vary according to the length of the incident involved. This section will provide only a general description of the information on the tape; to get a detailed listing refer to the analysis program documentation.

There are three types of records contained on each data set. The first record is a header block that contains all the documentation information. This gives incident location, affected freeways, weather conditions and any other information.

The second record is a lane sensor table that relates the logical sensor number used in the continuous time series data records to physical sensor location on the freeway.

The remaining records on the tape are continuous time series data blocks that contain the actual detector data.

Time series data contain an entry for each sensor every time it changes state. The entries are very general in nature giving only the logical sensor number, the time and whether the sensor is turning on or off. All entries are in chronological order.

The time given in the entries is accurate to 1/15 of a second since this is the sweep time the computer uses. The time entry will never be earlier than the change of state and at most 1/15 of a second late. Since this error occurs in the same direction for both the on and off times at a loop, the maximum error for vehicle duration over a loop is also 1/15 of a second.

#### 5. RAMP METERING

The California Department of Transportation is using ramp metering to help relieve congestion during urban peak traffic periods. Some of the sections of freeway used to collect data for this project are under either real-time or fixed-time traffic control during portions of the day.

Real-time control is when ramp metering rates are set by the computer that is being used to do the data collection. Within set limits, the computer can select the most appropriate metering rates for the current traffic conditions. This can have effect on traffic flow around an incident by allowing more cars on downstream from the incident.

Fixed-time control makes use of a historical table of metering rates run off a time of day clock. The rates are set by trial and error over a period of time and reflect the best average metering rate for any particular time period. This control is not traffic responsive and consequently cannot try to correct for an incident.

Sections of freeway under ramp control are:

Freeway Section	Time of Day	Date Began	Method
San Diego Fwy-Nbnd Marina Fwy to SM Pwy	0630 to 0930	Dec 75	Fixed-time
San Diego Fwy-Nbnd Harbor Fwy to 120th St	0600 to 0900	Dec 72	Real-time
Harbor Fwy-Sbnd SM Fwy to Century	1500 to 1830	Oct 71	Real-time
Harbor Fwy-Sbnd Century to SD Pwy	1500 to 1800	Oct 73	Fixed-time
Santa Monica Pwy-Wbnd Harbor Fwy to Overland	1545 to 1615	July 74	Fixed-time
Santa Monica Pwy-Ebnd National to Harbor Pwy	0630 to 0930	May 75	Fixed-time

## 6. FORTRAN ANALYSIS PROGRAM

In order to make the data sets more usable, an analysis program is being provided. This program is capable of generating summary data in either hard copy report format or as a condensed data set to be used in testing algorithms.

The analysis program is written in ANSI FORTRAN IV with no extensions. It should be usable, with only minor modifications to the I/O routines, on any machine with a FORTRAN IV compiler, a tape drive and 80K bytes of available memory.

The complete program documentation and instruction are included in Volume 3, "FORTRAN Program Documentation for Analyzing Individual Data Sets".

## 7. RUNNING THE ANALYSIS PROGRAM

When the analysis program starts, it gives the user the capability of specifying nine parameters that control what processing is to be done. The nine parameters are:

- OUTPUT** - An integer value code specifying the form of program output. The default value is zero (0).
- 0 - List documentation information and stop.
  - 1 - List documentation information and computed statistics.
  - 2 - Write documentation information and computed statistics to tape.
  - 3 - Both 1 and 2.
- LIMITS** - An integer value specifying whether or not changes are to be made to the stations limits of the freeway segments. Default is no change (zero).
- 0 - Use existing station limits.
  - 1 - Changes are to be made to the station limits.
- UPDINT\*** - An integer value designating the updating time interval in seconds. Default value is 20 seconds.
- AVGINT\*** - An integer value designating the averaging time interval in seconds. Default value is 60 seconds. AVGINT must be equal to or multiple of UPDINT.
- LSTINT** - An integer value designating the listing time interval in seconds. Default value is 20 seconds. Minimum value is UPDINT and maximum value is AVGINT. Valid parameter only when output is one (1) or three (3).
- ISTART** - A maximum of six (6) digit integer value designating the first averaging time for which statistics are to be averaged. Default value is the starting time of the input data tape (STIME). The program may adjust ISTART if it is less than (STIME + AVGINT) to the greater of (STIME + AVGINT) or (ISTART - AVGINT). The time is in the format HHMMSS where HHMM is the hour and minutes in military and SS is in seconds. Leading zeroes are optional and imbedded blanks are not allowed.
- IFINAL** - A maximum of six (6) digit integer value designating the last averaging time for which statistics are to be averaged. Default value is the input data tape ending time (ETIME). The format is the same as ISTART.
- SMPLRT** - An integer value designating the number of sensor samples per second for which the Continuous Time Series Data Records were collected. Default value of 15 times per second.
- GFACTR** - A real value designating a factor used in estimating density and speed. Default value of 2.8.

\*NOTE: (AVGINT/UPDINT) must be a value of 1 through 15.

## 8. ANALYSIS PROGRAM OUTPUT FORMAT

Hardcopy generated by the analysis program includes the documentation information and summarized traffic statistics as shown in Figures 2 through 4. The documentation information is fixed for each data set but the traffic data summaries can be varied by the user to get the time intervals or locations that he wishes.

Figure 2 illustrates the documentation information that is contained on the tape. The entries on this printout will be:

Tape No. - This is the identification number assigned to each tape and is in the format YYMMDDNN, where:

YY - refers to the year  
MM - is the month  
DD - is the day  
NN - is a number used to differentiate between data sets collected on the same day

Traffic Code - The traffic density level as explained in the Data Classification section of this volume.

Time Limits - These are the time limits for which data was collected for this data set. Time is based on a 24 hour clock.

Incident Location - Used only on incident data sets to indicate the two freeway stations between which the incident occurred. Format is FFSSD, where:

FF - indicates the freeway involved  
SM - Santa Monica Freeway  
SD - San Diego Freeway  
HA - Harbor Freeway  
SS - gives the freeway station  
D - gives the direction of travel  
N - North  
S - South  
E - East  
W - West

Affected Segments - This entry gives the number of and locations of the freeway segments from which data was collected. Freeway segments are in the same format as for the incident location.

Incident Type - Used only for incident data sets to indicate what occurred to affect traffic. Possible entries are:

TCOL - Traffic collision  
DISL - Disabled vehicle

TAPE NO. 74061033 TRAFFIC CODE - 3 FROM 07:01:00 TO 08:30:00

INCIDENT LOCATION: SM19E TO SM20E

AFFECTED SEGMENTS: 2

SEGMENT(1) FROM SM16E TO SM20E

SEGMENT(2) FROM SM20W to SM16W

INCIDENT TYPE: TCOL

VEHICLES INVOLVED: 3

LIGHT DUTY VEHICLES - 1

LIGHT TRUCKS - 1

HEAVY TRUCKS - 1

WEATHER AND ROAD CODES: WEATHER - C

VISIBILITY - O

PAVEMENT - D

DETECTION AND VERIFICATION: DETECTED AT 07:36:40 BY CODE C  
VERIFIED AT 07:39:00 BY CODE V

LAND MARKS: SIGN - E 1  
CALL BOX - SM182  
LOOP STATION - SM19E  
POST MILE - 10.24

TRAFFIC VOLUME COUNTS:

START TIME	STOP TIME	DURATION	COUNT
07:40:00	07:41:00	60	51
07:44:00	07:45:00	60	42

ADDITIONAL COMMENT LINES:

MAJOR ACCIDENT, MINOR INJURIES TO PU TK DRIVER

FIGURE 2 (CONTINUED)  
ILLUSTRATION OF DOCUMENTATION INFORMATION

SPIL - Spilled load  
GAWK - Gawking where people are looking at something either on or off the freeway.  
NOTH - No apparent reason for the incident.

Vehicles Involved - Indicates the total number of vehicles actively involved in the incident. The total is then broken down into three classes:

LIGHT DUTY VEHICLES - Cars, motorcycles and pickups.  
LIGHT TRUCKS - Vans and delivery trucks.  
HEAVY TRUCKS - Trucks larger than delivery van size.

Weather and Road Codes - Weather codes can be:

C - Clear  
L - Light rain  
H - Heavy rain

Visibility can be:

S - Sunny  
H - Hazy  
O - Overcast  
F - Foggy  
D - Dark

Pavement can be:

D - Dry  
P - Damp  
W - Wet

Detection and Verification - Detection is an indication if the incident was detected by the existing LAAFSCP incident detection logic. A code of "C" indicates that the computer detected the incident at the time indicated.

Verification is the method used to certify that there actually was an incident and not just a false alarm. The time indicates when verification was made and the code indicates the manner:

H - Helicopter  
C - California Highway Patrol  
V - Verification driver

Land Marks - This section gives physical reference points to where the incident occurred. The post mile locations of the changeable message signs, the call boxes and the loop stations are given in Appendix C.

SIGN - If the incident occurred on the Santa Monica Freeway this will indicate the nearest changeable message sign in the format DNN, where "D" is the direction either east or west and "NN" is the sign number from 1 to 35.

CALL BOX - Indicates the nearest freeway trouble phone and is the format FFNNN, where "FF" indicates the freeway, the same as under incident location, and "NNN" indicates the call box number.

LOOP STATION - Shows the closest loop station in the same format as used under incident location.

POST MILE - Indicates the actual position according to post mile measurements.

Incident Freeway Geometry - This section gives the lane configuration at the incident site. The heading M123456SRSCCS is broken up into three sections, M123456S, R and SCSCS, where the first is the freeway proper, the next is used to indicate a ramp and the last a collector-distributor road.

In the freeway section, the M refers to a median shoulder and the 1 through 6 indicate freeway lanes with the lanes numbered from left to right when facing in the direction of travel. The S refers to an outside shoulder.

The R in the ramp section indicates the presence or absence of either an on or off-ramp.

The collector-distributor road can show an S for the left hand shoulder, two traffic lanes and a right hand shoulder.

A one placed under the letter or number indicates that the item is present while a zero indicates that it is not.

For example:

M123456SRSCCS  
1111100100000

This is a four-lane freeway with a median shoulder and right hand shoulder, no ramps and no collector-distributor.

M123456SRSCCS  
1111110110000

This five-lane section has both a median and right hand shoulder and there is either an on or off-ramp

M123456SRSCCS  
1111100101101

This four-lane freeway with both shoulders also has a one lane collector-distributor with shoulders on both sides.

Incident Scenario Event Times - The meaning of the geometry heading is the same for this section as for the Incident Freeway Geometry.

Entries are arranged chronologically with a 1 in the columns that the comments refer to.

As an example, in Figure 2, the first entry there has 1's in the M, 1 and 2 columns. This would indicate that when the two trucks collided they blocked the median shoulder and two inside lanes. When the vehicle hit the trucks at 07:37:00, there was some question as to what lane he was traveling in so no entry is shown. The CHP and tow truck that arrived at 07:40:00 also worked on the shoulder and the two inside lanes, while the ambulance that arrived at 07:45:00 needed only the shoulder and one inside lane. (Abbreviations and codes used in the comments are explained in Appendix D.)

Traffic Volume Counts - If manual traffic counts were taken within the incident location, they will be recorded in this section. The duration is time in seconds and the count is for all freeway lanes.

Additional Comment Lines - Any comments that could not be fit into the Incident Scenario section will be placed here using the same abbreviations and codes.

Figure 3 is an example of the sensor index table. This figure gives a listing of all the active loops from which data was collected. The table is broken up into separate sections for each of the segments and for the environmental sensors.

The entries in the table are:

Sensor Index Number - This is the logical index number used to identify this sensor on this particular data set. This is the number used to select records from the data set and will not be needed by a user, unless he writes his own programs to access data on the tapes.

Freeway Station, Direction, Lane Type and Number - This section identifies the physical location of the loop on the freeway. The FWY STA DIR part follows the same format as used for the affected segment.

## SEGMENT(1) FROM SM16E TO SM20E SENSORS 1 TO 20

SENSOR INDEX NO.	FWY	STA	DIR	LANE TYPE	NO.	MBAI CODE	STATION INDEX NO.

49	HA	20	N	ENVW	1	1	

FIGURE 3 (CONTINUED)

ILLUSTRATION OF SENSOR INDEX TABLE

Within the lane type codes, the on-ramps, off-ramps, connectors and collector-distributor codes use suffixes of "A" and "B." The suffixes are needed to establish a unique identification because occasionally two separate on-ramps, etc., are associated with the same freeway station.

Possible lane type codes are:

LANE - Mainline freeway  
ONA, ONB - Freeway on-ramp  
OFFA, OFFB - Freeway off-ramp  
CONA, CONB - Freeway-to-freeway connector  
CDA, CDB - Collector-distributor road  
ENVT - Environmental sensor for temperature  
ENVL - Environmental sensor for light  
ENW - Environmental sensor for moisture

Lane number indicates the lane position within the station and is numbered from left to right when facing in the direction of travel.

MBAI Code - Modified, bad, active and inactive state code for the sensor.

Modified - The sensor was recently changed from the inactive state to the active state, or vice versa.

Bad - A malfunction was detected for this sensor.

Active - The sensor was collecting data at this time.

Inactive - The sensor was not collecting data at this time.

Code Number	Meaning
0	Inactive
1	Active
2	Bad, inactive
3	Bad, active
4	Modified, inactive
5	Modified, active
6	Modified, bad, inactive
7	Modified, bad, active

Station Index No. - These are the index numbers that the user must input, when starting the program, if he wishes to get a summary of only some of the stations.

For example, if only SM16E to SM17E is desired, then

1 2 00 00 00 would be used in the input parameters.<sup>1</sup>

However, if station SM17E and SM19W to SM17W were desired, then

2 2 7 9 00 00 would be input.

Figure 4 is an example of the 20-second traffic data summaries that will be printed out. The heading for each segment gives the time interval and the station limits of the subtotal.

The vertical format of the date entries is:

\_\_\_\_\_ HEADING \_\_\_\_\_

Mainline lane

:

Mainline station summary

Ramp, collector and connector individual lane data

Ramp, collector and connector individual lane data

\_\_\_\_\_ HEADING \_\_\_\_\_

:

The mainline station summary gives an average of the individual lane values for occupancy, VOL/LN/HR, DENSITY and SPEED and a total of the individual lane values for volume.

The data entries used are:

OCCUPANCY - This represents the percent of time that a vehicle was actually within the influence area of the loop.

VOLUME - The count of vehicles that pass over the loop.

VOL/LN/HR - Hourly volume per lane.

DENSITY - Vehicles per lane per mile. This value is calculated by using occupancy and an assumed average vehicle length.

SPEED - A calculated speed (MPH) from hourly lane volume, occupancy and an assumed average vehicle length, e.g., Speed=Volume/(2.8 x occupancy).

<sup>1</sup> For a full discussion of the input parameters, see Volume 3.

TIME IS 07:01:00 FROM STATION SM16E TO STATION SM20E

FIGURE 4 (CONTINUED)

ILLUSTRATION OF TRAFFIC DATA SUMMARY

## APPENDIX A

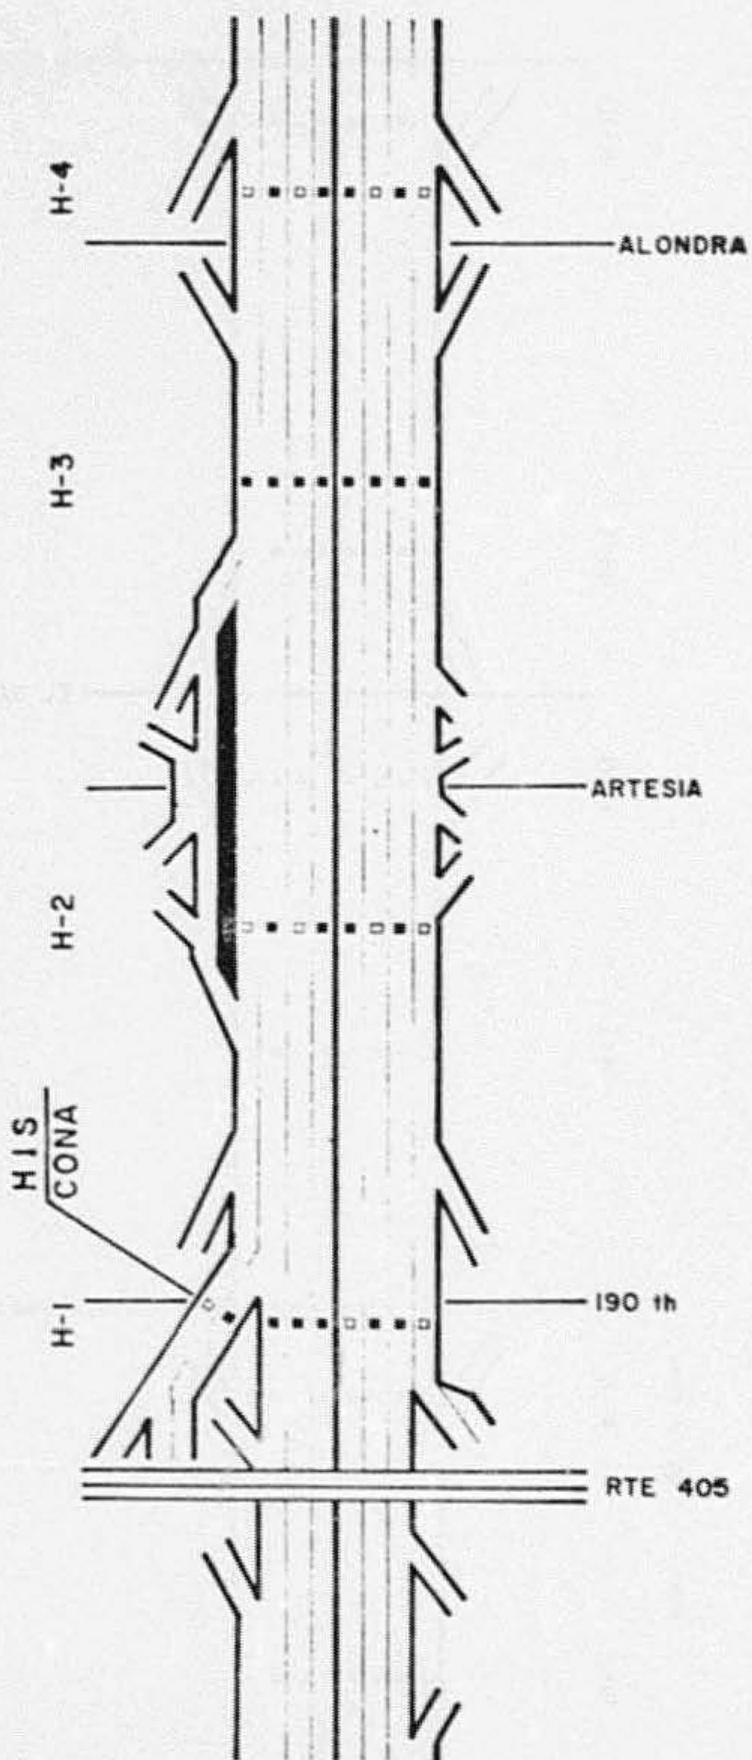

### Loop Location Maps

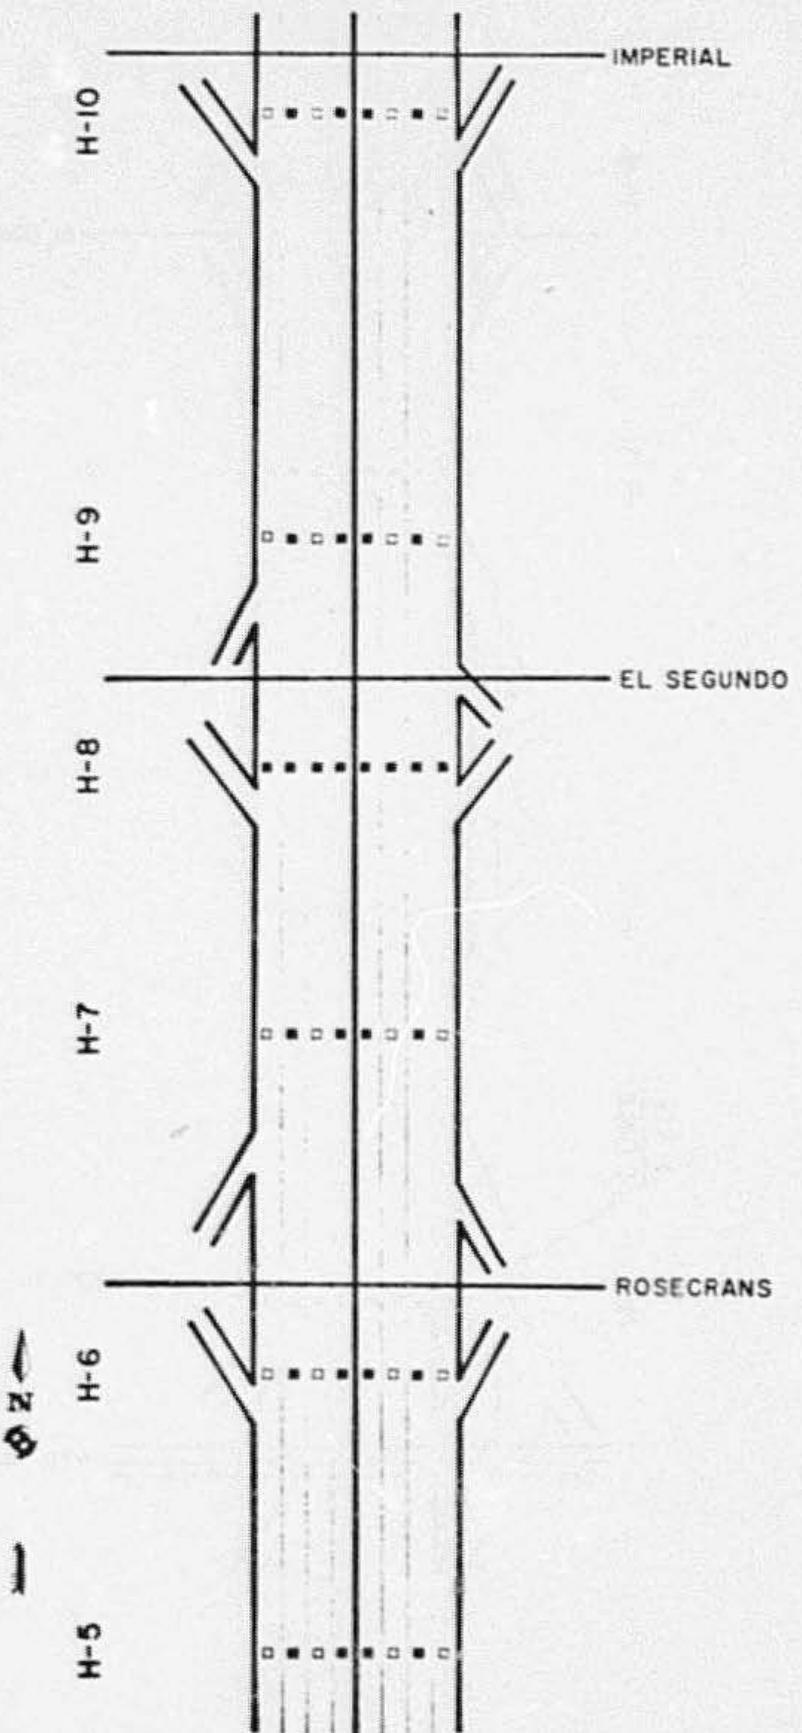

This set of maps gives a schematic view of the freeways used for the data collection. They illustrate the number of lanes at each location, the loops that were connected to the computer and the location of ramps and collector roads. Active and inactive loops are designated by the following symbols:

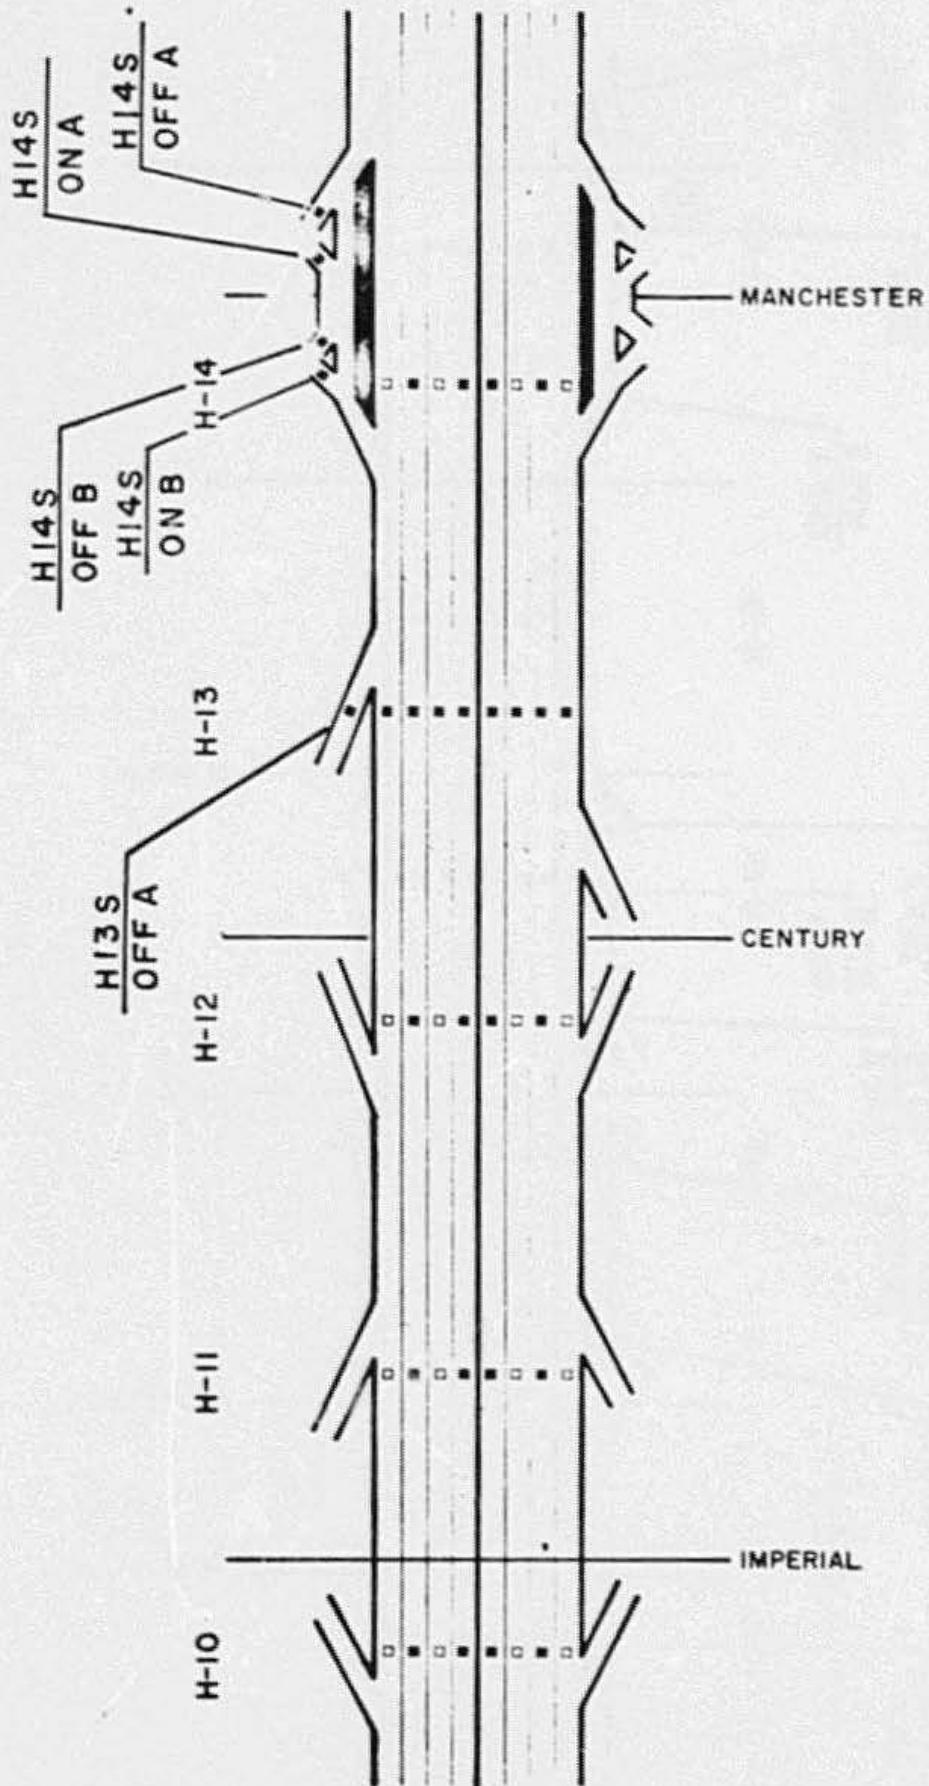

- - Active Loop
- - Inactive Loop

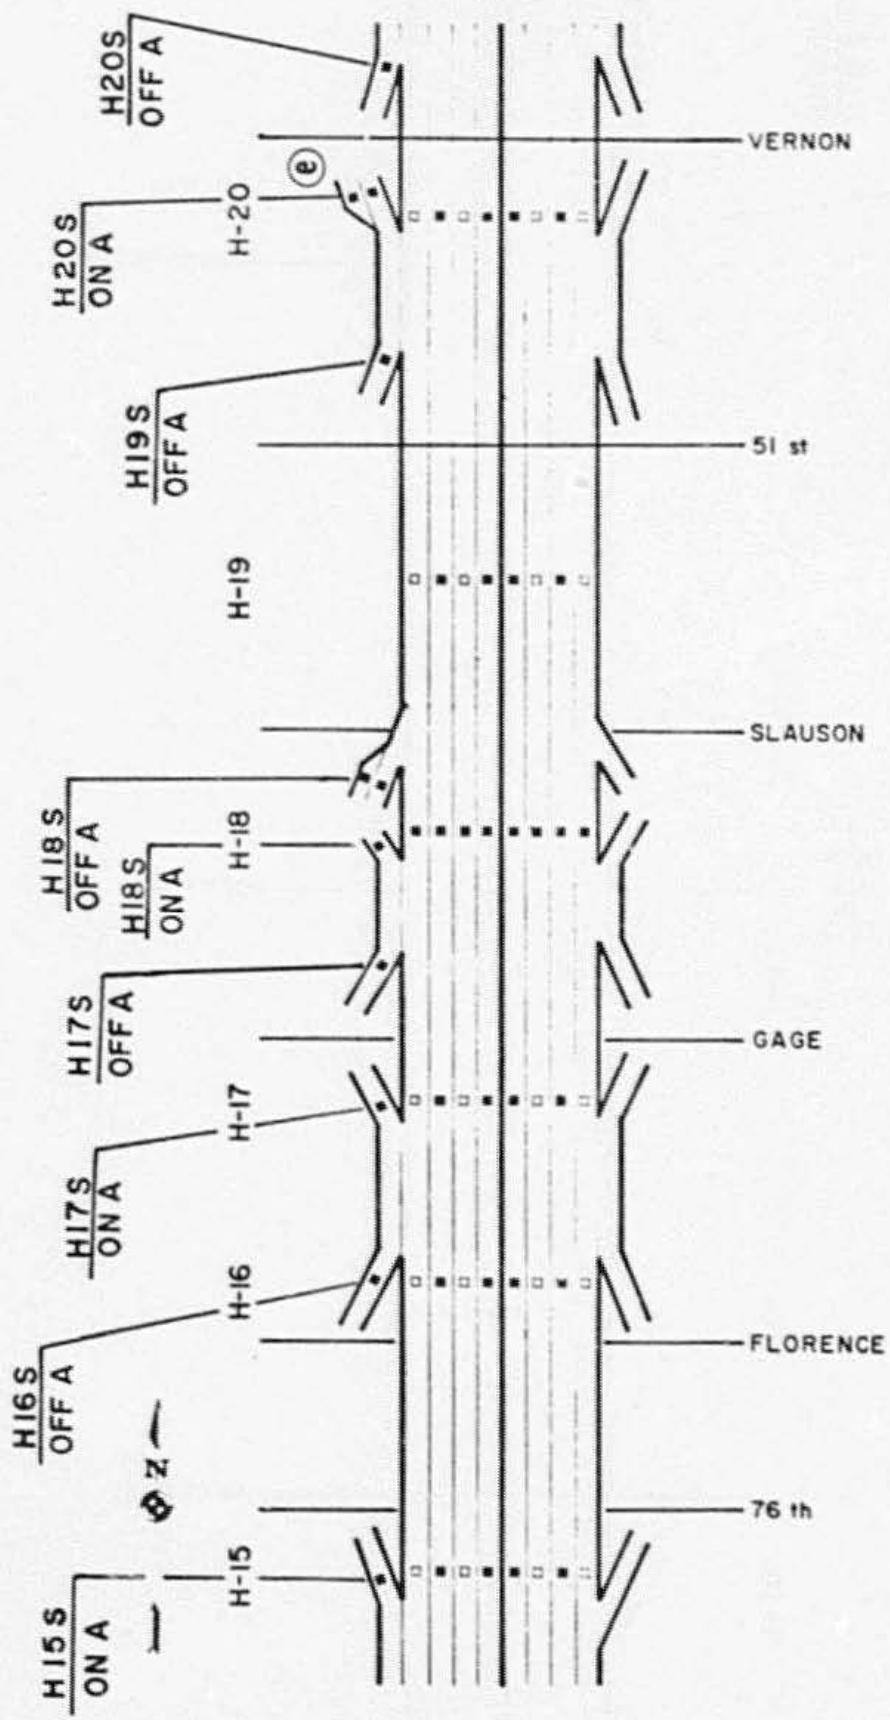

### TABLE OF CONTENTS

	<u>PAGE</u>
HARBOR FREEWAY STATIONS (H-1 through H-25)	25-29
SANTA MONICA FREEWAY STATIONS (SM-1 through SM-28)	30-34
SAN DIEGO FREEWAY STATIONS (SD-1 through SD-32)	31-40

## APPENDIX B

### Narrative Description of Data Sets

This appendix provides short description of the data contained on each of the data sets.

A certain amount of information can be obtained from the data set number, i.e.:

74062802-2

— This is the traffic density level.

— This is the data set number for the day. This was the second data set collected this day. 0 through 49 are used for incident data sets and 50 through 99 are used for non-incident data sets.

— This is the date of data collection. June 28, 1974.

Abbreviations used in referring to incident location and data collection segments are:

SM - Santa Monica Freeway  
SD - San Diego Freeway  
HA - Harbor Freeway  
N - North  
S - South  
W - West  
E - East

For user convenience, a numerical listing of both incident and non-incident data sets are given in Appendix E.

## APPENDIX C

This set of tables gives the post mile locations of freeway call boxes and loop stations on the Santa Monica, San Diego and Harbor Freeways. Also included is a table which gives the locations of the changeable message signs on the Santa Monica Freeway.

<u>TABLE OF CONTENTS</u>	<u>PAGE</u>
1. CALL BOX LOCATIONS	43-46
A. SANTA MONICA FREEWAY	43
B. SAN DIEGO FREEWAY	44-45
C. HARBOR FREEWAY	46
2. LOOP STATIONS	47-49
A. SANTA MONICA FREEWAY	47
B. SAN DIEGO FREEWAY	48
C. HARBOR FREEWAY	49
3. CHANGEABLE MESSAGE SIGNS - SANTA MONICA FREEWAY	50

## APPENDIX D

This appendix gives a glossary of the abbreviations and codes that are used in the documentation information for the individual data sets.

### GLOSSARY OF TERMS

- (1) VPH - Vehicles per hour
- (2) LAAFSCP - Los Angeles Area Freeway Surveillance and Control Project
- (3) T.C. - Traffic collision (T/C)
- (4) CHP - California Highway Patrol
- (5) C/D - Center divider or center median
- (6) Break (traffic) - Highway Patrol escorting a queue of vehicles to enable removal of a traffic hazard
- (7) Veh - Vehicle
- (8) Arr - Arrived
- (9) 1098 - California Highway Patrol code for assignment completed or leaving the scene
- (10) 1097 - California Highway Patrol code for arriving at the scene
- (11) LN - Lane
- (12) G.O.A. - Gone on arrival
- (13) Amb - Ambulance
- (14) CHPM - California Highway Patrol Motorcycle unit
- (15) DOT - California Department of Transportation (Caltrans)
- (16) Repts - Reports
- (17) O/C - Overcrossing
- (18) Maint - Caltrans Maintenance
- (19) P.U. - Public Utility
- (20) UTL - Unable to locate
- (21) R/S - Right shoulder
- (22) Ped - Pedestrian
- (23) Collector - Collector-distributor road
- (24) Mtrst - Motorist
- (25) Flatbed - Flatbed truck
- (26) M/C - Motorcycle
- (27) N/B - Northbound
- (28) S/B - Southbound
- (29) SDF - San Diego Freeway
- (30) PU TK - Pick Up Truck
- (31) CMS - Changeable Message Sign
